

Perception

The entire subject of perception is the subject of energy. As the preclear goes down the tone-scale, he is less capable of differentiation and is thus less and less capable of handling energy and is more and more subject to energy, until at last he will not emanate or handle energy. Even in the higher ranges of this descent his perception begins to diminish.

The rehabilitation of perception is essentially the rehabilitation of force. Force is rehabilitated by rehabilitating the control of energy. This is done by ARC processing and in many other ways. The chief way in which this is done is by establishing the preclear's ability, by creative processing, to handle blackness.

An entire science called perceptics can easily be constructed and is mentioned in the original thesis (1948).

The rehabilitation of sight in the blind, hearing in the deaf, the ability to speak, anaesthesia of the body or body areas or the genital organs, depends upon the rehabilitation of the preclear's ability to handle energy. Creative processing, with particular attention to handling blackness, is essential in this process.
